#128

Think First

Many people believe that working fast means working smart…
But in reality, work started without thinking often ends up being done twice.

“Work without thinking is the beginning of rework.”

Taking just one minute to think…
can save hours of hard work.

If an engineer starts work without checking the drawings…
the entire installation may need to be redone.

If a student studies without planning…
panic arrives before the exam.

If a manager makes decisions without understanding the ground reality…
the whole team gets confused.

Even nature teaches us this lesson…
A bird first chooses the right place for its nest,
and only then starts arranging each straw.

Speed is important…
but speed without direction only creates exhaustion.

Before starting any work, ask yourself three questions:

* What am I doing?
* Why am I doing it?

* What is the best way to do it?

Remember…

“Think First… Work Next.”

Because a good thought is always cheaper than rework.
